

CAMILLE ONODA

Junior Backend / Infrastructure Engineer

Backend Systems • Linux • Networking • Technical Communication

Nagoya, Japan | French (Native) • English (Fluent) • Japanese (JLPT2)

info@camilleonoda.com | github.com/CamilleOnoda | linkedin.com/in/camilleonoda

Professional Summary

Junior technical professional transitioning from seven years of international technical translation and review into software engineering and infrastructure.

Built backend systems in Go and Python, including a production-style webhook relay service and an HTTP/1.1 server from scratch, developing practical knowledge of APIs, networking, databases, concurrency, testing, and system reliability.

Currently expanding further into Linux system administration, networking, troubleshooting, and infrastructure through hands-on work in Linux virtual machines. Comfortable working from the command line, managing services and processes, configuring SSH, investigating ports and network connectivity, and working with containers.

I bring a combination of technical curiosity, structured problem-solving, documentation skills, and experience communicating across international teams in French, English, and Japanese.

Technical Skills

Programming: Go, Python, SQL, Bash fundamentals

Backend: REST APIs, HTTP, PostgreSQL, sqlc, authentication, integration testing

Linux and Systems: Linux CLI, users and permissions, processes, systemd, package management, filesystems, SSH

Networking: TCP/IP fundamentals, ports and listening services, routing, DNS, DHCP, network interfaces, connectivity troubleshooting

Containers and Cloud: Docker, Podman, AWS fundamentals, Railway, Render

Tools: Git, GitHub, VS Code, VirtualBox

Collaboration: Technical documentation, requirements clarification, asynchronous teamwork, cross-cultural communication

Technical Projects

Webhook Relay Service

Go • PostgreSQL • REST APIs

Live demo: <https://webhook-relay-production-5e97.up.railway.app/>

GitHub: <https://github.com/CamilleOnoda/webhook-relay>

- Designed and implemented a backend service for reliable asynchronous webhook delivery.
- Designed authenticated REST APIs and PostgreSQL data models for endpoint and event management.
- Implemented background delivery workers, retry scheduling, and dead-letter handling.
- Added integration testing using PostgreSQL and containerized test environments.
- Worked with deployment, environment configuration, authentication, database migrations, and production troubleshooting.
- Produced architecture documentation to support maintainability and continued development.

HTTP Server from Scratch

Python • TCP/IP • HTTP/1.1

GitHub: <https://github.com/CamilleOnoda/http-server-python>

- Built an HTTP/1.1 server from first principles using Python sockets.
- Implemented request parsing, routing, persistent connections, compression, and concurrent request handling.
- Worked directly with TCP connections and HTTP protocol behavior rather than relying on a web

framework.

- Validated behavior through automated tests and documented implementation decisions.
- Published a technical article explaining the underlying HTTP concepts.

Cross-functional Software Development

Chingu Voyage 61

GitHub: <https://github.com/chingu-voyages/V61-tier3-team-35>

- Collaborated remotely with an international software development team.
- Defined API contracts between frontend and backend components.
- Participated in sprint planning, backlog refinement, and technical discussions.
- Used GitHub-based collaborative development and asynchronous communication.
- Helped maintain alignment as project scope and team composition changed.

Linux and Infrastructure Practice

Hands-on Linux administration and troubleshooting using Ubuntu virtual machines.

- Manage users, groups, permissions, processes, jobs, and system services.
- Inspect and troubleshoot services using systemd and system logs.
- Configure and troubleshoot SSH connections between Linux and Windows systems.
- Investigate interfaces, IP addresses, routes, DNS, ports, and listening services using tools including ip, ss, netstat, lsof, ping, and related Linux utilities.
- Transfer and synchronize files over SSH using scp and rsync.
- Install and manage software through Linux package management and work with source-based installation fundamentals.
- Run and inspect containerized applications using Docker and Podman.
- Practice Linux command-line problem solving and troubleshooting in isolated VM environments.

Professional Experience

Freelance Technical Translator / Reviewer

Japanese and English → French | 2019–Present | Japan / Remote

- Work with international clients across Europe, North America, and Japan on technical and software-related content.
- Analyze complex source material and translate it into precise, understandable information for different audiences.
- Independently manage multiple projects while balancing deadlines, requirements, terminology, and quality expectations.
- Identify inconsistencies and ambiguities in source material and communicate issues clearly with clients and project stakeholders.
- Work extensively in remote and asynchronous international environments.
- Developed strong documentation, analytical, and cross-cultural communication skills transferable to technical support and engineering environments.

Education and Certifications

- Boot.dev — Backend Engineering Program | 11/2024–06/2026
- AWS Certified Cloud Practitioner | 04/2024
- PCEP™ — Certified Entry-Level Python Programmer | 11/2024
- Harvard CS50 Computer Science & CS50 Python | 2023–2024
- Master's Degree in English-French Translation | 2019
